

Title: Lab 2: Agile Backlog Creation & Sprint Simulation

Scenario: EV Charging Station Reservation System

Name: K S Anagha

Sec: CSE-D

SRN: PES1UG24CS208

Section 1 — Screenshots

1. "Backlog: Epics and User Stories"

2. "Story Point Assignments"

3. "Sprint Board (Active Sprint view, mid-progress)"

4. "Burndown Chart — Sprint 1"

5. "Burndown Chart—Sprint 2"

Section 2 — Reflection Questions

1. Did your estimations reflect the actual effort?

Ans:

Broadly yes — points ranged from 2 (simple, like Cancel Reservation) to 8 (complex, like Make Payment with gateway integration), though since this was simulated, actual effort wasn't tracked against them.

2. Was your backlog well-prioritized?

Ans:

Yes — priorities matched the Lab 1 requirements table: core booking-flow stories (Search, Reserve, Cancel, Pay) were High, while View Dynamic Rate was Medium since it's a nice-to-have, not a blocker.

3. How did your simulated sprint align with your plan?

Ans:

Both sprints completed 100% of planned stories with nothing carried over, though all tasks moved to Done within one short session instead of across a real week.

4. What insights did the burndown chart give about your team's capacity?

Ans:

Both charts showed a sharp near-vertical drop instead of a gradual decline, reflecting the compressed simulation — in a real sprint that pattern would signal overestimation or last-minute rushing rather than steady daily progress.
